Report Overview

The titanium sputtering target is made of titanium metal. It is a low-strength, high-strength metal with good ductility (especially in an oxygen-free environment), gloss and metallic white. The high melting point (above 1,650°C or 3,000°F) makes it useful as a refractory metal. Industrial grade titanium sputtering targets and arc cathodes are used for decorative coatings, and high-purity titanium sputtering targets with a purity of up to 99.999% are usually used in integrated circuits, DRAM and flat panel display applications. When high-purity titanium is used to sputter LSI, VLSI and ULSI circuit networks, these integrated components can be made lighter, thinner, smaller in size and denser in wiring.

The global High Purity Titanium Sputtering Target market size was estimated at USD 136.10 million in 2023 and is projected to reach USD 206.00 million by 2030, exhibiting a CAGR of 6.10% during the forecast period.
