High purity trifluoromethane (CHF_3), also known as fluoroform or R-23, is a specialized gas compound characterized by its exceptionally low impurity levels, typically exceeding 99.95% purity, making it suitable for demanding applications in semiconductor manufacturing, electronics etching, and refrigeration systems. It serves as a critical precursor in plasma-based processes for cleaning chemical vapor deposition (CVD) chambers and etching silicon-based materials, where even trace contaminants can compromise device performance and yield. Additionally, its properties as a low global warming potential (GWP) refrigerant align with environmental regulations, though its primary demand stems from the microelectronics industry, where precision and reliability are paramount.

The global High Purity Trifluoromethane market size was estimated at USD 88.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
