Abstracts

Quantum efficiency (QE) is a measure of how effectively an imaging device converts incident photons into electrons. For example, if a sensor has a QE of 100% and is exposed to 100 photons, it will produce 100 electronic signals. In practice, sensors are never 100% effective, and different sensor technologies have different QE values. The most high-end scientific cameras can achieve QE of up to 95%, but this depends on the wavelength of the light being detected.

The global High Quantum Efficiency Imaging Sensor market size was estimated at USD 1850.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
