Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High Refractive Index Eyeglass Lens Materials competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global high refractive index eyeglass lens materials refer to optical materials production reached approximately 600,000 units, with an average global market price of around US\$140 per unit. High refractive index eyeglass lens materials refer to optical materials with a refractive index higher than that of traditional resins (1.50) or glass (1.52), typically ranging from 1.56 to 1.74 or even higher. These materials achieve enhanced light-reflecting capabilities through specialized chemical compositions (such as sulfur compounds, high-refractive-index monomers, or metal oxide doping). This allows lenses with significantly reduced center and edge thickness for the same diopter. These materials are particularly suitable for patients with high myopia or hyperopia, offering both lightweight and impact resistance. However, these materials may be associated with higher dispersion and reflectivity, necessitating coating processes to optimize optical performance. Market demand continues to escalate as consumers pursue thinner, lighter, and more functional lenses. Coupled with growing health needs such as myopia prevention and control and presbyopia correction, the sales share of high-refractive-index lenses is gradually increasing. Experiments have shown that high-refractive-index eyeglass lens materials excel in reducing dispersion and improving impact resistance. Lenses made from these materials are one-third thinner than those made from conventional materials and offer significantly better weather and heat resistance than traditional materials, making them an ideal choice for individuals with severe myopia and frameless eyewear designs.

The global High Refractive Index Eyeglass Lens Materials market size was estimated at

USD 95.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
