## Abstracts

High refractive index ophthalmic lens monomers are used in the production of ophthalmic lenses for vision correction, offering the ability to create lenses that are thinner, lighter, and more efficient than traditional materials, ideal for individuals with high prescriptions. Changes in lifestyle result in an increased number of people with eye conditions. For example, reduced time spent outdoors, increased near work and increased rates of urbanization, among other factors, may contribute towards a substantial increase globally in the number of people with myopia. According to estimates that take into account the growth in urbanization and in the human development index, the number of people with myopia will increase from 1.95 billion in 2010 (uncertainty interval (UI) 1,422 million to 2,543 million) to 3.36 billion in 2030 (UI 153 million to 589 million). During the same period, the number of people with high myopia, often associated with severe complications, is projected to increase from 277.2 million in 2010 (UI 153 million to 589 million) to 516.7 million in 2030 (UI 298 to 1,082 million). With more and more people will suffer from myopia problems are as well as the high requirements on the spectacle lenses, the high refractive index ophthalmic lens monomers market will be driven to grow fast.
