Abstracts

High Resolution Anoscopy (HRA) is a specialized diagnostic medical procedure used to detect and evaluate precancerous and cancerous lesions in the anogenital region, particularly in patients at risk for or diagnosed with human papillomavirus (HPV)-related diseases, such as anal intraepithelial neoplasia (AIN) and squamous cell carcinoma; the technique involves the use of a colposcope—a binocular microscope with a light source—to magnify the anal canal and perianal skin after application of acetic acid and Lugol's solution, which helps highlight abnormal tissue for targeted biopsy or treatment, thereby serving as a critical tool for early intervention and management in populations with elevated risk, including individuals with HIV, a history of receptive anal intercourse, or previous HPV-related cervical or vulvar dysplasia.

The global High Resolution Anoscopy market size was estimated at USD 170.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
