Report Overview

Scanning tunneling microscopy is a type of scanning probe microscopy. Based on the detection of the magnitude of the tunneling current between the probe and the surface, fluctuations at the single-atom level on the surface can be observed. In addition, scanning tunneling microscopy can use probe tips to precisely manipulate individual molecules or atoms at low temperatures, so it is not only an important micro-nano scale measurement tool, but also a potential micro-nano processing tool. It is an instrument that uses the quantum tunneling effect to detect the surface structure of matter.
