Report Overview

A high sensitivity metal detector is a specialized device that is designed to detect the presence of metal objects that may be hidden or buried beneath the surface of the ground, or within materials such as food, wood, or textiles. High sensitivity metal detectors typically use a coil of wire that generates a magnetic field when an electrical current is passed through it. When the coil is moved near a metallic object, the magnetic field induces an electric current in the object, which in turn produces its own magnetic field. The detector senses this change in the magnetic field and alerts the user to the presence of a metal object. These detectors are often used in security and industrial applications, as well as in treasure hunting and archaeological exploration.

The global High Sensitivity Metal Detector market size was estimated at USD 320.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
