Report Overview

High shear in-line mixers can be used for homogenization, dispersion, emulsification or particle size reduction. An inline high shear mixer features an inlet feeding ingredients perpendicularly into the shearing zone, and an outlet discharging product axially. An inline high shear mixer feeds and outputs material in a continuous stream and material is often perfectly hydrated, emulsified, or homogenized in a single pass. Batch mixers, by comparison, require ingredients to be mixed for longer periods of time in a tank, and 100% dispersion is rarely achieved lowering product yields and wasting valuable ingredients. Inline high-shear mixers offer a few advantages over batch mixers. They allow for a more controlled mixing environment, they're less bulky, they allow for continuous inline mixing and they can produce results within a fraction of the time.
