Abstracts

A high shear inline mixer is a device that uses high-speed rotating blades or rotors to generate high shear forces for mixing. The working principle of a high shear inline mixer is to generate strong shear forces through the narrow gap between the high-speed rotating blades or rotors and the stator. This shear force can quickly break up, disperse and evenly mix the materials. During the mixing process, the liquid or semi-fluid material is pulled and forcibly sheared by the blades or rotors, thereby forming high-intensity shear forces, torsional forces and extrusion forces, achieving rapid mixing and homogenization of the materials.

The global High Shear Inline Mixer market size was estimated at USD 519.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.80% during the forecast period.
