## Abstracts

A high silicon iron anode, specifically high silicon cast iron anode, is an electrode made from a cast iron alloy containing a high percentage of silicon. This composition provides exceptional corrosion resistance, particularly in acidic and harsh environments. These anodes are primarily used in cathodic protection systems to protect buried or submerged metal structures from corrosion. They function by acting as a sacrificial anode, releasing ions that prevent the protected metal from corroding. High silicon cast iron anodes are favored for their durability and long service life in demanding applications, such as protecting pipelines, tanks, and marine structures. The high silicon iron anode industry is influenced by upstream raw material costs, including iron ore and silicon. Downstream, demand is driven by infrastructure maintenance and expansion, especially in the oil and gas, and water treatment sectors. Product specifications are focusing on improved alloy compositions for specific environmental conditions and optimized casting techniques for enhanced performance. The future market is expected to see steady growth due to aging infrastructure requiring ongoing corrosion protection. Increased investments in water and wastewater infrastructure, and the expansion of offshore energy projects, will further drive demand. Environmental concerns are pushing for more efficient production and recycling.

The global High Silicon Iron Anode market size was estimated at USD 120.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
