Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High Slump Retention Polycarboxylate Superplasticizer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. High slump retention polycarboxylate water reducer is a polymer water reducer with acrylic acid or maleic acid/acrylate as the main chain and polyether side chains. It is characterized by significantly reducing water consumption (or increasing slump) while prolonging the slump maintenance time. It is used for concrete that requires a long construction time or slump retention. The core upstream raw materials are polycarboxylate superplasticizer monomers, such as HPEG and TPEG. These monomers are synthesized from chemical raw materials such as ethylene oxide (EO). Fluctuations in EO prices directly impact the cost of both the monomers and the resulting superplasticizer. Downstream, these monomers are primarily used in commercial concrete, precast concrete units, and other applications. They are widely used in various large-scale projects requiring high concrete performance, such as high-speed railways, subways, bridges, highways, and docks. Global sales in 2024 are expected to be approximately 9.3 million tons, with an average market price of approximately \$530 per ton. Single-line production capacity varies depending on the production process and investment in production equipment, typically ranging from 50,000 to 500,000 tons per year, with industry gross profit margins ranging from 30% to 50%. The continued construction of infrastructure such as highways, railways, bridges, and urban rail transit has created a stable market demand for high-slump-retention polycarboxylate superplasticizers. The global goal of carbon neutrality and increasingly stringent environmental policies are driving the construction industry towards greener, higher-performance construction. High-performance superplasticizers help conserve

cement and reduce production energy consumption, aligning with the development of green building materials. The raw materials for high-slump-retention polycarboxylate superplasticizers primarily include ethylene, ethylene oxide, and polyether monomers. The prices of these petrochemical derivatives are significantly influenced by international oil prices, supply and demand, and international trade policies, directly impacting production costs. For example, in April 2025, the decline in ethylene oxide prices weakened the cost support for water reducer monomers, causing its market price to decline.

The global High Slump Retention Polycarboxylate Superplasticizer market size was estimated at USD 4929.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
