Report Overview

The axle gearbox of high-speed railway vehicles, also known as the final drive gearbox, is a key component of high-speed trains, transmitting power from the motor to the wheels. The gearbox is usually located directly on the axle and is responsible for reducing the high rotational speed of the motor to the speed required by the wheels. The axle gearbox of high-speed railway vehicles usually consists of a gearbox, gears, bearings, and seals. The gears are designed to mesh with each other and transmit power from the motor to the wheels. The bearings support the gears to reduce friction between the gears and the gearbox housing, while the seals prevent dirt and moisture from entering the gearbox. The design of axle gearboxes for high-speed railway vehicles is crucial for the reliable and efficient operation of trains. It must be able to withstand the high speed, load, and temperature experienced by the train, while providing sufficient lubrication and protection for the gears and bearings.
