Abstracts

The high-speed railway rail wheel is a crucial component of high-speed railway vehicles, usually made of high-quality alloy steel through advanced forging and heat treatment processes. It is designed to have excellent wear resistance, high strength, and good fatigue resistance to withstand the high-speed rotation and large dynamic loads during the operation of high-speed trains. The wheel consists of parts like the rim, web, and hub. The rim is the outermost part that directly contacts the rail, and its surface is precisely machined to ensure a good fit with the rail, reducing wear and noise. The web connects the rim and the hub, providing structural support and bearing part of the load. The hub is used to connect with the axle and is equipped with corresponding mounting holes and keyways to ensure a reliable connection with the axle.

The global High Speed Railway Rail Wheel And Axle market size was estimated at USD 1392.94 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
