## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High Temperature Alloy GH2132 competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. GH2132 is a precipitation-hardening deformation high-temperature alloy based on Fe-Ni-Cr, with an operating temperature range of -253°C to 650°C. The synergistic effect of nickel (24-27%), chromium (13.5-16%), titanium, molybdenum and other elements in its composition gives the alloy excellent high and low temperature strength, creep resistance and oxidation resistance through  $\gamma'$  phase precipitation strengthening, while also having good processing plasticity and weldability. The alloy improves purity by reducing the content of impurities such as sulfur and gas, and optimizes the heat treatment process to ensure long-term stability in extreme environments.

The global High Temperature Alloy GH2132 market size was estimated at USD 837.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
