High-temperature disinfection cabinet is achieved by heating the temperature to 100 °C and keeping it for more than 15 minutes, so as to achieve the purpose of sterilization. This type of high-temperature sterilization mainly includes microbial organisms including bacteria and viruses. High temperature disinfection cabinets generally use far-infrared heating. Electric heating elements heat air or generate radiant heat. After the appliance is exposed to high temperature for a period of time, the surface of bacteria, viruses, and other microbial organisms is deformed and killed.
