Report Overview

Elastomers are basically polymers, which have high viscosity and elasticity but weak intermolecular force. The elastomers have the property of elasticity that is it regains its original shape on the removal of the deforming forces. Monomers of elastomers consist of silicon, carbon, oxygen, and hydrogen. Elastomers are of two type one containing thermoplastic properties other with thermosetting properties. Thermoplastic elastomers belong to polymers category and they melt at a specific temperature. However, thermosetting elastomers do not melt at high temperatures hence are called as high-temperature elastomers. Commonly high-temperature elastomers do not melt but convert into gaseous state at high temperatures. The properties inherent in elastomers are high elongation, flexibility, and combination of damping and resilience. These set of properties of elastomers make them an ideal material for seals, isolators, and gaskets.
