Report Overview

High Temperature Filters have the filtration efficiency to operate under temperature of more than 350 degree Celsius and they find their use in major industries such as in the oil and gas, power generation, automotive amongst others. The filter media majorly used is ultrafine glass fibers homogenously spun. The major usage is in the filtration of flue gases in the power generation plants, cement plants, steel plants amongst others. The use of high temperature filters has increased the process efficiency, heat recovery, protection and increasing the life of the equipment. The high temperature filters mainly helps in dust filtration which otherwise could cause damage to the system like corrosion, fouling etc. There are stringent regulations pertaining to air purity and emissions which is projected to create positive traction in the high temperature filters market.

The industrial growth in emerging countries as one of the primary factors that will trigger the growth of the high-temperature filters market in the coming years. To reduce the dependence on imports, the emerging countries across the world are focusing on domestic manufacturing and consumption to meet the rising internal demand for manufactured goods. Several governments are motivated to develop and allure investors in local industries. The leading consumer of high-temperature filters across the world is the secondary or manufacturing industry. This factor will have a direct influence on the demand for high-temperature filters. In India, the Make in India initiative by the government has motivated domestic manufacturing and increased the percentage of manufacturing in the country's overall production output.
