Abstracts

High temperature heat pump units are designed for applications that require high temperature hot water or steam, and are widely used in heating and hot water supply for industrial production, commercial buildings and large residential areas. Compared with traditional heat sources, high temperature heat pump units can provide hot water output up to 90°C or even higher, while significantly improving energy efficiency, reducing operating costs and carbon emissions. The core technology of this unit lies in its efficient compressor and optimized heat exchange system, which extracts heat from low temperature heat sources (such as air, water or soil) through the reverse Carnot cycle principle and raises it to the required high temperature.

The global High Temperature Heat Pump Units market size was estimated at USD 1253.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
