High temperature prepregs are composite materials composed of continuous fiber reinforcements (such as carbon, glass, or aramid fibers) pre-impregnated with thermosetting or thermoplastic resin systems engineered to withstand sustained exposure to extreme temperatures?typically above 177°C (350°F)?without significant degradation in mechanical or thermal properties; these materials are partially cured (B-staged) during manufacturing to allow for handling and processing, and they require final curing under elevated temperature and pressure to achieve their full structural performance, making them essential in applications demanding high thermal stability, chemical resistance, and strength-to-weight ratios.

The global High Temperature Prepreg market size was estimated at USD 4200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
