## Abstracts

High-temperature solid oxide electrolysis (SOEC) is an advanced electrochemical system for efficiently producing hydrogen from water vapor at temperatures of 700-1000°C. Its core utilizes an all-solid-state ceramic structure, with an oxygen-ion-conducting solid oxide electrolyte as the key component. Driven by external electrical energy, water molecules are reduced to high-purity hydrogen at the cathode, while oxygen ions pass through the electrolyte and are oxidized at the anode to form oxygen. This technology significantly enhances the electrochemical reaction kinetics through high temperatures, allowing some thermal energy to replace electrical energy, thereby drastically reducing hydrogen production energy consumption and achieving an energy conversion efficiency of over 85%. It is currently the mainstream technology for large-scale green hydrogen production coupled with nuclear energy, high-temperature renewable energy, and industrial waste heat.

The global High-temperature Solid Oxide Electrolysis (SOEC) Technology market size was estimated at USD 156.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 37.00% during the forecast period.
