Abstracts

High-throughput screening (HTS) systems are experimental platforms designed for the rapid and automated testing of large numbers of biological or chemical samples, widely used in drug discovery, gene function research, and materials science. These systems integrate automated equipment, detection instruments, and data analysis software to process thousands to millions of samples in a short time, efficiently identifying compounds with specific biological activities or chemical properties. Consumables refer to various disposable or replaceable experimental materials used in the high-throughput screening process, such as microplates, reagents, pipette tips, and cell culture dishes. The design and performance of these consumables directly impact the efficiency and accuracy of screening experiments. The growth of the high-throughput screening (HTS) systems market is primarily driven by the demand for efficient drug discovery tools in the pharmaceutical and biotechnology industries. As the cost and time required for new drug development continue to rise, there is an urgent need for technologies that can rapidly screen large compound libraries and identify potential drug candidates. High-throughput screening systems enhance drug discovery efficiency and reduce R&D costs through automation, parallel processing, and large-scale data analysis. Additionally, the rise of personalized medicine and precision medicine has fueled the demand for HTS systems, as these fields require the rapid identification of effective therapeutic targets for specific patient populations. Furthermore, government support policies and funding for biomedical research have further accelerated market expansion. The high-throughput screening systems market is moving toward higher levels of automation, intelligence, and integration. The application of artificial intelligence and machine learning is becoming increasingly widespread, helping to optimize screening processes and improve the accuracy of data analysis. Moreover, the introduction of microfluidic technology and 3D cell culture models has made screening processes more reflective of

in vivo environments, enhancing the reliability of screening results. With technological advancements, HTS systems are also becoming more compact and portable to meet the needs of small and medium-sized laboratories. At the same time, there is growing demand for multifunctional and modular systems, as users seek to perform multiple screening tasks on a single platform, thereby improving equipment utilization and flexibility. These trends collectively drive innovation and diversification in the high-throughput screening systems market.

The global High-Throughput Screening (HTS) Systems and Consumables market size was estimated at USD 1880.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
