Abstracts

A high torque stepper motor is a special stepper motor that can output a large torque at a lower speed, thus meeting the needs of high-load and high-precision driving. High torque stepper motors work based on the principle of electromagnetic induction. Similar to ordinary stepper motors, they generate a rotating magnetic field by energizing each phase winding of the motor in a certain order, causing the rotor to rotate under the action of electromagnetic force. However, high torque stepper motors have been optimized in design and manufacturing, such as increasing the number of winding turns and using high-performance magnetic materials, so that under the same input current, a stronger magnetic field can be generated, thereby outputting a greater torque.

The global High Torque Stepper Motor market size was estimated at USD 619.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
