Report Overview:

High viscosity cements – These types of cements primarily are comprised of PMMA with no methylmethacrylate-styrene-copolymer content; they have no runny state at all. Immediately after mixing, the cement is doughy and ready to apply by hand to the implant surface. The working time for high viscosity cements needs to be closely monitored; it is not always easy to determine the end of the working time before it is too stiff to interdigitate with the bone.
