## Abstracts

A dual planetary mixer is a highly efficient mixing device, mainly used in the mixing, dissolving, kneading and reaction processes of high-viscosity and high-density materials. Its core components include one or more stirring paddles, which can both revolve and rotate under the drive of the planetary gear system. Revolution refers to the rotation of the stirring paddle around the central axis of the mixing tank, while rotation refers to the rotation of the stirring paddle itself. This dual motion mode allows the material to move up and down and around in the mixing tank, thereby achieving uniform mixing in a shorter time.

The global High Viscosity Dual Planetary Mixers market size was estimated at USD 1467.77 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
