Report Overview:

An aluminum electrolytic capacitor, usually simply called an electrolytic capacitor (e-cap), is a capacitor whose anode (+) consists of pure aluminum foil with an etched surface, covered with a uniformly very thin barrier layer of insulating aluminum oxide, which operates as a dielectric. The electrolyte, which covers the rough surface of the oxide layer, operates as the second electrode, the cathode (-). E-caps have the largest capacitance values per unit volume compared to the two other main conventional capacitor families, ceramic and plastic film capacitors, but articulately smaller capacitance than similar sized supercapacitors.

The Global High Voltage Aluminum Electrolytic Capacitors Market Size was estimated at USD 436.52 million in 2023 and is projected to reach USD 515.18 million by 2029, exhibiting a CAGR of 2.80% during the forecast period.
