Abstracts

A high voltage charge pump is an electronic circuit that utilizes capacitors and switches to generate a higher DC output voltage from a lower DC input voltage through a process of charging and discharging stages, typically employing a clock signal to control the switching sequence; unlike inductive boost converters, charge pumps are capacitor-based, making them compact, efficient for low-to-medium power applications, and free from magnetic components, which reduces electromagnetic interference and simplifies design in space-constrained environments such as integrated circuits, display drivers, MEMS actuators, and biomedical devices where precise high-voltage bias is required.

The global High Voltage Charge Pump market size was estimated at USD 155.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
