Report Overview:

High-voltage dry-type air-core shunt reactor is a high-voltage application air-core shunt reactor with dry cooling method. The air-core shunt reactor is an inductive high-voltage electrical appliance used in the power system to limit short-circuit current, reactive power compensation and equal shifting. The magnetic flux forms a loop through the air, so it is called an air-core reactor. The air-core shunt reactor can be directly connected to the power line or the third winding of the three-winding transformer to keep the voltage stable when the load changes.

The Global High Voltage Dry Type Air Core Shunt Reactor Market Size was estimated at USD 582.24 million in 2023 and is projected to reach USD 745.26 million by 2029, exhibiting a CAGR of 4.20% during the forecast period.
