Abstracts

High Voltage Metal Oxide Varistors (MOV) are electronic components mainly composed of metal oxides such as zinc oxide. They are characterized by their nonlinear voltage-current characteristics. Under normal voltage conditions, MOVs exhibit high resistance, allowing only a very small leakage current to pass through. However, when the voltage exceeds a certain threshold value, their resistance decreases sharply, enabling them to conduct a large amount of current. This property makes them particularly suitable for protecting electrical and electronic systems from overvoltage surges. They are widely used in power transmission and distribution systems, high-voltage electrical equipment, and various electronic devices to suppress overvoltage and protect against lightning strikes and other transient overvoltage threats, thereby ensuring the safe and stable operation of the equipment.

The global High Voltage Metal Oxide Varistors Mov market size was estimated at USD 2452.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.10% during the forecast period.
