Abstracts

A High Weir Spiral Classifier is a type of mechanical equipment used primarily in mineral processing and ore beneficiation plants to separate fine solid particles from a liquid suspension based on differences in sedimentation rates. It consists of an inclined trough with a rotating spiral at the bottom, which continuously lifts settled coarse material (typically sand or ore particles) up the inclined surface for discharge, while the overflow weir allows the finer particles and water to flow out. This classification process is essential for controlling particle size distribution in grinding circuits, improving grinding efficiency, and preparing material for subsequent separation stages such as flotation or gravity concentration. The high weir design increases the settlement area, enhancing the separation of fine and coarse particles by providing a larger pool volume and a higher overflow level, making it particularly suitable for applications requiring finer classification or handling materials with higher pulp densities.

The global High Weir Spiral Classifier market size was estimated at USD 127.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
