Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Highly Active Alginate Oligosaccharide competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. High activity alginate oligosaccharide are low molecular weight oligosaccharides extracted from brown algae (such as seaweed, bok choy, etc.), usually obtained through enzymatic or chemical hydrolysis methods. These oligosaccharides are composed of small amounts of monosaccharide units (such as mannose, glucose, etc.) and have strong biological activity, which can produce significant immune regulation, antioxidant, anti-inflammatory and other effects in the body. In 2024, global Highly Active Alginate Oligosaccharide production reached approximately 1,750 MT, with an average global market price of around US\$ 28 per kg. The annual production capacity of a single production line is 100 tons, and the gross profit margin is about 40%. Upstream raw materials: brown algae/kelp, sodium alginate (sodium alginate) Downstream applications: food, agriculture, cosmetics. Direct raw material costs account for about 50%-60%; manufacturing expenses account for about 25%-35%; other costs account for about 10%-15%.

The global Highly Active Alginate Oligosaccharide market size was estimated at USD 49.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
