Abstracts

Highly dispersible boehmites are synthetic aluminum oxide hydroxides (γ -AlOOH) characterized by their exceptionally fine particle size, high specific surface area, and superior colloidal stability in both aqueous and non-aqueous media, achieved through specialized synthesis and surface modification techniques that minimize agglomeration and enhance compatibility with various matrices. These materials exhibit pseudoboehmitic structure with high purity and controlled porosity, making them particularly valuable as performance additives?serving as dispersants, rheology modifiers, anti-settling agents, and reinforcing fillers?across industries such as lithium-ion battery separators and electrodes, ceramics, catalysts, coatings, and polymers, where uniform distribution, enhanced mechanical properties, thermal stability, and improved processability are critical.
