Abstracts

Hirudin is a natural anticoagulant protein initially extracted from leeches, known for its powerful blood-thinning properties. It works by directly binding to thrombin, inhibiting its activity, and thus effectively preventing blood coagulation. Over time, the production of hirudin has transitioned from natural extraction to recombinant DNA technology, significantly improving production efficiency, safety, and product consistency. Common hirudin-based products include Lepirudin (Refludan) and Desirudin (Iprivask), which are primarily used in the treatment and prevention of thrombotic diseases such as deep vein thrombosis (DVT), pulmonary embolism (PE), and thrombus-related cardiovascular conditions. Hirudin products are particularly suitable for patients who cannot use traditional anticoagulants, such as those with heparin-induced thrombocytopenia (HIT). These products have a longer half-life and can be used during surgeries for anticoagulation therapy. Additionally, they are frequently applied in intensive care units and dialysis treatments.The demand for hirudin-based drugs is growing, primarily driven by the increasing incidence of thrombotic diseases, the aging population, and the rising need for safer and more effective anticoagulants. With technological advancements, the production costs of hirudin-based medicines are gradually decreasing, making them more affordable. Moreover, the application of these drugs in specific patient populations is expanding, further increasing their market potential.

The global Hirudin-based Drugs market size was estimated at USD 4200.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.00% during the forecast period.
