Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on HNB E-Cigarette Stick competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. HNB (Heated Tobacco Products) are tobacco products that work by continuously heating a specially designed tobacco cartridge containing tobacco at a temperature below combustion temperature to produce a nicotine-containing aerosol for inhalation. HNB reduces the temperature at which tobacco forms a nicotine-containing aerosol by heating, rather than burning, avoiding the incomplete combustion and high-temperature harmful substances produced by traditional cigarettes, reducing harmful substance release by up to 90%. HNB devices (heated tobacco products) are electronic devices used to heat tobacco-based products at controlled temperatures, producing a nicotine-containing aerosol for inhalation through heating rather than combustion. The core principle is to use electric heating elements, ceramic heating elements, or metal heating needles to heat the tobacco material to approximately 250?350?C, causing the tobacco to release inhalable substances, rather than the high-temperature combustion process of approximately 800?C in traditional cigarette combustion. These devices are typically used with dedicated heat-sticks or tobacco capsules. The device itself does not contain tobacco; its function is to control the heating temperature to achieve thermal decomposition of the tobacco material without causing open flame combustion, and to stably release inhalable aerosols. These products are generally classified as "non-combustion tobacco delivery devices." The devices consist of circuit boards, chips, heating elements, batteries, and plastic parts, and are durable goods, usually manufactured by external contractors or in partnership with manufacturers. The mainstream heating technologies include resistance, electromagnetic, and infrared heating. The core challenge is to solve problems related to heating efficiency, uneven

heating leading to a burnt taste, and cleaning and maintenance. In 2024, the global production of HNB E-Cigarette Sticks reached 38.33 million units, with an average selling price of US\$31.43 per unit and a gross profit margin of approximately 30.28%. The annual output was 36 million units. Downstream customers include China National Tobacco Corporation, Altria, British American Tobacco, Japan Tobacco, Imperial Tobacco, Philip Morris International, etc. Heated tobacco products can reduce the harm to the human body caused by tar and other harmful substances emitted from the high-temperature combustion of traditional tobacco while satisfying nicotine intake, addressing the psychological burden of traditional smokers and consumers who want nicotine intake. From a product perspective: mature HNB products overseas, such as IQOS, have gained recognition from consumers in Japan, South Korea, Russia, and other countries, with rapidly increasing penetration rates. Currently, China's regulation of e-cigarettes is similar to that of tobacco products, and there are no clear policies yet for HNB products. The strength of policy regulation depends on how governments in different countries define the attributes of e-cigarette products, which is mainly based on factors such as the level of awareness/acceptance of the harm reduction effect of e-cigarettes, the perception of their appeal to teenagers, and the level of acceptance that they can effectively reduce the smoking rate of traditional tobacco.

The global HNB E-Cigarette Stick market size was estimated at USD 1205.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.70% during the forecast period.
