Abstracts

Hollow cathode lamps (HCLs) are specialized light sources used primarily in atomic absorption spectroscopy (AAS), a technique for detecting trace metal concentrations in samples. These lamps operate by generating a low-pressure gas discharge between a cathode made of the element to be analyzed and an anode within a sealed glass envelope filled with an inert gas, such as argon or neon; when voltage is applied, metal atoms are sputtered from the cathode into the gas phase, where they become excited and emit sharp, element-specific spectral lines at precise wavelengths, which are then used for quantitative analysis due to their high intensity and narrow bandwidth.

The global Hollow Cathode Lamps (Hcl) market size was estimated at USD 112.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.65% during the forecast period.
