Abstracts

Hollow wrist robots are a type of robot widely used in industrial automation. They feature a hollow structure in the wrist of the robot arm. The hollow design allows transmission cables such as cables and air pipes to pass through the inside of the robot arm instead of being exposed on the outside, which significantly improves the reliability and flexibility of the equipment. Robots with this structure can effectively avoid the problem of traditional external wiring being easily entangled, worn or broken, and are particularly suitable for industrial scenarios that require high precision and complex movements, such as welding, spraying, assembly, handling and grinding.

The global Hollow Wrist Robot market size was estimated at USD 2725.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.60% during the forecast period.
