Abstracts

The holographic aerial imaging system is a system that uses advanced optical imaging technology to produce three-dimensional images directly in the air without a physical medium. This system projects the three-dimensional information of the object into the air in the form of light through a series of complex optical processing and calculations, providing the audience with the experience of watching real stereoscopic images at close range. Holographic aerial imaging technology is based on the principles of light interference and diffraction, and forms a three-dimensional image by recording and reproducing all the information (including amplitude and phase) of the light emitted by the object. In the holographic aerial imaging system, the micromirror array chip plays a vital role. This chip consists of thousands of tiny mirrors, which can accurately control the angle of each mirror to reflect light, thereby realizing the modulation of the light field and the reconstruction of the image. The holographic aerial imaging system requires a high-brightness, high-monochromaticity laser as a light source, and modulates and transmits the light through a precise optical system to ensure the clarity and stability of the image. The development status and dynamics of the holographic aerial imaging system market can be summarized from the following aspects: The holographic aerial imaging system has been widely used in entertainment, advertising, exhibitions, education, medical care and other fields due to its unique visual effects and wide application scenarios. For example, in stage performances and exhibitions, holographic aerial imaging technology can create realistic 3D effects and unique visual experiences, attracting the attention of a large number of audiences and merchants. With the continuous improvement of hardware technology and imaging algorithms, the projection effect of the holographic aerial imaging system will be more realistic, bringing users a more realistic virtual scene experience. At the same time, new technological breakthroughs will also promote the application and expansion of holographic aerial imaging systems in more fields. With the increasing demand of consumers for high-

quality and high-definition projection, as well as the rapid development of tourism, culture, education, medical care and construction, the demand for holographic aerial imaging technology is also growing. This will bring more development opportunities and growth space to the market. With the continuous development of the market, the industrial chain of holographic aerial imaging systems is also gradually improving. All links, including holographic projection content production companies, equipment manufacturers, technical support service providers, etc., are constantly strengthening cooperation and collaboration to jointly promote the healthy development of the market. In summary, the holographic aerial imaging system market is in a rapid development stage, and the market size continues to grow. In the future, the holographic aerial imaging system market is expected to usher in a broader development prospect.

The global Holographic Aerial Imaging System market size was estimated at USD 549.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.40% during the forecast period.
