## Abstracts

A holographic plate is a transparent glass or plastic sheet that can record the diffraction patterns of a hologram. These diffraction patterns contain the amplitude and phase information of the object, and through appropriate reconstruction, a three-dimensional image of the object can be presented. In the process of holography, the holographic plate plays the role of recording and reproducing the three-dimensional information of the object. When a beam of coherent light (called illumination light) is irradiated on an object, the object scatters and forms object light. The object light interferes with another reference light that is directly irradiated on the holographic plate to form interference fringes. These interference fringes are recorded by the holographic plate and contain the amplitude and phase information of the object. In the reconstruction process, an appropriate light source (such as a laser) is used to illuminate the holographic plate, and the light will present a three-dimensional image of the object based on the previously recorded diffraction pattern.

The global Holographic Board market size was estimated at USD 155.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
