## Abstracts

A Holographic Data Storage System (HDSS) is an advanced data storage technology that records data in three dimensions using holography. This system uses laser interference to encode data within the volume of a storage medium, rather than just on its surface. Unlike traditional storage systems that store data in binary format on the surface of a disk, holographic storage utilizes the entire volume, which allows for higher storage density and faster data access. The key advantage of holographic storage is its potential for massive data storage capacities, fast read/write speeds, and the ability to handle large amounts of data simultaneously. This technology is being explored for future applications in high-capacity data centers, large-scale archives, and other fields that require substantial data storage solutions.

The global Holographic Data Storage System market size was estimated at USD 294.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 21.60% during the forecast period.
