Abstracts

Holographic film is a very thin, flexible plastic film [Polyester (PET), Oriented Polypropylene (OPP) and Nylon (Bonyl)] which has been micro-embossed with patterns or even images. Patterns (such as checker plate or diamonds) or an image (such as a tiger) are created by way of an embossing process which can provide a remarkable 3-D effect and/or spectral (rainbow) coloring. The embossing process is akin to cutting tiny grooves into the films surface at various angles and in different shapes. These micro-embossed grooves cause the ?diffraction? of normal white light into stunning spectral color. This phenomenon is not unlike the diffraction of white light into spectral colors through a crystal prism. Holographic films can also be laminated to different types of materials. This combination is often used for brand-enhancing packaging applications. Holographic films can also be laminated to sealable films to make form, fill and seal roll stock packaging or premade flexible bags. It can be laminated to paper or card stock to make consumer packaging and specialty gift boxes and bags. Holographic nylon films can be extrusion coated with sealable polyethylene (PE) for manufacturing into metallic balloons. Holographic polyester films (PET) can also be coated with special adhesives to make holographic hot stamping foils for decorative application to paper or card stock. The top five manufacturers in the world are ITW Security Division, K Laser, Huagong Technology, Cosmo Films, and Shenzhen University Aurora Technology. The top five manufacturers in the world account for more than 37% of the market. Although there are many participants in the industry, the industry concentration is generally high.

The global Holographic Lamination Film market size was estimated at USD 758.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
