Abstracts

Holographic radar is a technical device that works on the principles of holography and radar. Holographic radar combines the advantages of holography and radar technology. Holography is a technology that uses the principles of interference and diffraction to record and reproduce the real three-dimensional image of an object, while radar is an electronic device used to detect information such as the target's distance change rate (radial velocity), azimuth, and altitude. Holographic radar obtains the radar stereo image of the target through a two-stage method, which is similar to optical holography and can achieve three-dimensional imaging and real-time monitoring of the target. With the continuous development of science and technology, holographic radar technology is also constantly improving and improving. In the future, holographic radar is expected to achieve higher resolution, longer detection distance, and a wider range of application scenarios. At the same time, the integration of holographic radar with other technologies will also become one of the development trends. For example, the combination with technologies such as artificial intelligence, big data, and the Internet of Things will further enhance the intelligence level and application capabilities of holographic radar.

The global Holographic Radar market size was estimated at USD 596.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.30% during the forecast period.
