Abstracts

Global sales of home and office wireless routers reached 94.3 million units in 2024, with an average selling price of \$33.15 per unit. Home and office wireless routers are devices used to wirelessly distribute internet signals via Wi-Fi to multiple devices (such as smartphones and laptops), and can also connect devices via wired connections. There are two main types: single-device routers and mesh routers, suitable for small spaces and large/multi-story spaces, respectively. When choosing one, consider network standards (such as Wi-Fi 5, Wi-Fi 6), coverage, stability, and whether it supports mesh networking systems. The main raw materials for home and office wireless routers are chips (SoC, Wi-Fi baseband and RF, Ethernet PHY), PCB boards, memory and flash memory, plastic or metal casings, power adapters, and passive components. Chips alone account for about 40% of the raw material cost, and overall, direct materials account for over 80% of the factory cost. The cost structure is highly material-heavy and labor-light: raw materials account for approximately 80%-90%, direct labor 5%-10%, and manufacturing costs 3%-7%. Therefore, price fluctuations in core chips, memory, and high-end PCBs have the greatest impact on profits.

The global Home and Office Wireless Router market size was estimated at USD 3126.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
