Honeycomb fenders are designed with a hexagonal honeycomb structure, which has high compression resistance and buffering performance. They can effectively disperse impact force and are suitable for occasions that need to withstand large impacts. Conical fenders are conical in shape and are usually made of rubber or composite materials. They have good elasticity and wear resistance and are suitable for buffering protection when ships are berthing. They can reduce friction and collision damage between the hull and the dock. Both are widely used in water facilities such as ports and docks to protect the safety of ships and structures.
