Report Overview:

Low pressure chemical vapor deposition (LPCVD) is a chemical vapor deposition technology that uses heat to initiate a reaction of a precursor gas on the solid substrate. This reaction at the surface is what forms the solid phase material. Low pressure (LP) is used to decrease any unwanted gas phase reactions, and also increases the uniformity across the substrate. As the name implies, chemical vapor deposition (CVD) is a process of depositing a solid film on the surface of a wafer through a chemical reaction of gas mixing, which is a technology often used in semiconductor manufacturing. CVD technology has the advantages of low deposition temperature (500 °C ~ 1100 °C), easy control of film composition and thickness, film thickness proportional to deposition time, good uniformity and repeatability, excellent step coverage, easy operation, and wide application range.

The Global Horizontal LPCVD Market Size was estimated at USD 197.72 million in 2023 and is projected to reach USD 293.41 million by 2029, exhibiting a CAGR of 6.80% during the forecast period.
