## Abstracts

PECVD is a method or equipment known for its low-temperature deposition of thin films. The process temperature usually only needs to be in the lower temperature range of 200 to 400°C. Its basic principle is to use microwaves or radio frequencies to ionize the gas containing the atoms that make up the film to form a highly chemically active plasma, thereby depositing the desired film on the substrate. Among various types of PECVD equipment, tubular PECVD is widely used in the crystalline silicon cell industry. This equipment uses a quartz tube as the deposition chamber and a resistance furnace as the heating body. A graphite boat that can hold multiple silicon wafers is inserted into the quartz tube for thin film deposition. The major global tubular PECVD companies include Applied Materials, ASM International, Lam Research, Wonik IPS, Meyer Burger, Centrotherm, Tempres, Plasma-Therm, S.C New Energy Technology and Jusung Engineering. Among them, the market share of the Top 5 companies has reached 80%, and the market height Concentration, high-end PECVD equipment is mainly monopolized by American and European companies.

The global Horizontal PECVD market size was estimated at USD 1825.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
