Abstracts

Horizontal sub-cylinder is the main supporting equipment of steam boiler tank manufacturers. It has the characteristics of standardized production, complete varieties, quality assurance and customized services. It is mainly used in power generation, petrochemical, steel, cement, construction and other industries, especially in the distribution and concentration of steam and condensed water in steam or hot water boiler rooms, as well as the distribution and concentration of high and low pressure steam, condensed water, hot water and cooling circulating water in industrial plants. The steam-water separation device of the horizontal sub-cylinder usually adopts a built-in cyclone separator or baffle separator. The cyclone separator uses the rotational motion of steam to make the water droplets be thrown to the wall of the device under the action of centrifugal force, and then flow down along the wall and discharge. The baffle separator separates the water droplets by multiple turns of steam between the baffles due to inertia collision with the baffle.

The global Horizontal Sub-Cylinder market size was estimated at USD 742.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
