Abstracts

Hormone antineoplastic drugs represent a specialized class of cancer therapeutics that target hormone-dependent malignancies by interfering with hormone production, signaling, or metabolism, thereby inhibiting tumor growth and proliferation; these agents are primarily used in the treatment of breast, prostate, and certain gynecological cancers, and include categories such as selective estrogen receptor modulators (SERMs), aromatase inhibitors, antiandrogens, and gonadotropin-releasing hormone (GnRH) agonists/antagonists, functioning through mechanisms that either block hormone receptors or suppress endogenous hormone synthesis. The global market for hormone antineoplastic drugs is characterized by steady growth driven by rising cancer incidence, advancements in targeted therapy, and increasing adoption of combination treatments, with key players focusing on developing next-generation agents with improved efficacy and reduced side effects; however, the market faces challenges such as patent expirations, biosimilar competition, and high treatment costs, while regional variations in accessibility and reimbursement policies influence market dynamics across developed and emerging economies.

The global Hormone Antineoplastic Drugs market size was estimated at USD 14280.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
