Abstracts

Hormone herbicides are a type of selective herbicide that simulates the mechanism of action of natural auxins (such as indoleacetic acid) in plants, interferes with the normal growth regulation process of plants, causes abnormal cell division, tissue deformity, physiological disorders, and ultimately causes weed death. This type of herbicide is mainly used to control broadleaf weeds and is relatively safe for gramineous crops (such as wheat and corn). Common representatives include 2,4-D and MCPA, which are widely used in agriculture, horticulture and non-arable land weed control.

The global Hormone Herbicide market size was estimated at USD 610.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
