Report Overview

Hose reel irrigation sprinkler uses a water turbine type power drive system. Adopting the design of large section and small pressure, a higher recovery speed can be achieved under a small flow rate. The water turbine speed is led from the water turbine shaft to a two-speed belt drive device and transmitted to the reducer. After the speed is reduced, the chain The transmission produces a large torque force to drive the winch to rotate, so as to realize the automatic recovery of the PE pipe. At the same time, the high-pressure water flowing out of the water turbine flows through the PE pipe directly to the sprinkler. The sprinkler sprays the high-pressure water evenly over the crops, and then spreads into small water droplets to fall evenly. The spraying operation is carried out non-intermittently as the PE pipe moves.
