Abstracts

Hot cathode vacuum gauges are precision instruments used to measure low-pressure environments, typically in the high vacuum to ultra-high vacuum range (10^{-2} to 10^{-10} Torr or Pa), by utilizing a heated filament (cathode) to emit electrons that ionize gas molecules within the chamber, with the resulting ion current being proportional to gas pressure, making them essential in applications requiring accurate and stable pressure monitoring, such as semiconductor manufacturing, scientific research, particle accelerators, thin-film deposition systems, and space simulation chambers, where their reliability, sensitivity, and ability to provide continuous readings are critical for process control and experimental integrity.

The global Hot Cathode Vacuum Gauge market size was estimated at USD 180.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
